

Risk areas: Risk (predominantly *P. falciparum*) exists throughout the year in the whole country including all coastal beach resorts, except there is generally no risk in Nairobi nor in areas above 8,200 feet (2,500 meters) in Central, Eastern, Nyanza, Rift Valley, and Western provinces. High risk exists on all typical safari itineraries.

Protective measures: Medicines that protect against malaria in this area include mefloquine (Lariam), doxycycline, or atovaquone/proguanil (Malarone). Primaquine may be used in special circumstances (G6PD testing is required). The best drug for you depends on your itinerary and on a number of personal factors that should be discussed between you and your health care provider.
